convert_units

v. 1.x

Christian Biscombe

9 October 2017

convert_units performs unit conversions, providing a command-line interface to the Units module that accompanies rxntoarb (lib/units.rb in the rxntoarb root directory). convert_units requires Ruby 1.9 or newer.

1 Invocation and command-line options

convert_units is invoked as follows:

convert_units [options_list] <input_string> [output_units].

input_string should consist of an optional numerical value (assumed to be 1.0 if not specified) and a list of unit abbreviations, all of which should be separated by spaces. Accepted unit abbreviations may be accessed by calling convert_units with the -1 flag, but there shouldn't be too many surprises; of note are degC, degF, and degR for °C, °F, and °R, respectively. Any valid SI prefix (see Table 1) may immediately precede the unit name; note that u is used for the 'micro' prefix. Exponents on units should immediately follow the unit name, optionally preceded by the ^ character. Use of a solidus (/) to indicate reciprocal units is not supported; use negative exponents instead.

The optional output_units should contain the units into which the input is to be converted, following the same conventions described above. If output_units is present then it must have the same dimensions as input_string. If output_units is omitted (or an empty string) then conversion to SI base units will be performed.

The optional options_list may include any of the following:

name	prefix	factor	name	prefix	factor
yotta	Y	10^{24}	deci	d	10^{-1}
zetta	\mathbf{Z}	10^{21}	centi	\mathbf{c}	10^{-2}
exa	\mathbf{E}	10^{18}	milli	m	10^{-3}
peta	Р	10^{15}	micro	u	10^{-6}
tera	${ m T}$	10^{12}	nano	\mathbf{n}	10^{-9}
giga	\mathbf{G}	10^{9}	pico	p	10^{-12}
mega	${f M}$	10^{6}	femto	f	10^{-15}
kilo	k	10^{3}	atto	a	10^{-18}
hecto	h	10^{2}	zepto	${f z}$	10^{-21}
deka	da	10^{1}	yocto	У	10^{-24}

- -a|--arb Output in *arb* format, i.e. with units in square brackets before the numerical value. Implies -d.
- -d|--double-precision Output is formatted using the letter d for exponents (Fortran double precision copy-and-paste mode).
- -f|--format <format> Output is formatted using the specified format string. Any format string recognised by Ruby's Kernel#sprintf method is valid.
- -1|--list List all recognised units and their abbreviations.
- -s|--sig-figs Output with the same number of significant figures as the input. Over-rides -f.
- -t|--tdiff Specifies that input temperatures should be interpreted as temperature differences rather than references to absolute temperatures. See § 2 for examples.
- -v|--version Print version information.

2 Examples

```
> convert_units 'nM'
1e-06 mol m-3
> convert_units '0.84 pmol cm-2 min-1'
1.4e-10 mol m-2 s-1
> convert_units '11.893 mile h-1' 'ft s-1'
17.4431 ft s-1
arb format:
> convert_units -a '0.84 pmol cm-2 min-1'
[mol m-2 s-1] 1.4d-10
```

```
Double precision mode:
> convert_units -d '0.84 pmol cm-2 min-1'
1.4d-10 \ \text{mol} \ \text{m}-2 \ \text{s}-1
> convert_units -d '11.893 mile h-1' 'ft s-1'
17.4431d0 ft s-1
Custom output formats:
> convert_units -f '%.3e' '1478.5 kJ kg-1 K-1' 'BTU lb-1 degF-1'
3.531e+02 BTU lb-1 degF-1
> convert_units -f '%.3f' '1478.5 kJ kg-1 K-1' 'BTU lb-1 degF-1'
353.132 BTU lb-1 degF-1
> convert_units -f '%.3g' '1478.5 kJ kg-1 K-1' 'BTU lb-1 degF-1'
353 BTU lb-1 degF-1
Significant figures mode:
> convert_units '10 atm' 'Pa'
1.01325e+06 Pa
> convert_units -s '10 atm' 'Pa'
1.0e+06 Pa
Temperature conversions:
> convert_units '100 degC'
373.15 K
> convert_units -t '100 degC'
100 K
> convert_units -- '-40 degC' 'degF'
> convert_units -t -- '-40 degC' 'degF'
-72 degF
```
